

APPENDIX 8 – DETAILED ECONOMIC SECTOR ANALYSIS FROM ORGANIZATIONAL TYPOLOGY (CHAPTER 5)

Technology & Software is the most represented sector (23%), reflecting that many community-led initiatives build software tools and digital infrastructure. This sector spans organization types: Loomio (DC) and Linux Foundation (PP) produce software; Matrix (PP) develops communication protocols; Monlam AI (DS) and DAIR (DS) work on AI systems.

Advocacy & Rights is the second most represented sector (21%), signifying the presence of organizations focused on asserting community rights rather than producing goods or services. This sector concentrates in DS (6 cases: FNIGC, GIDA, MAIAM NAYRI WINGARA, Te Mana Raraunga, Detroit CTC, WAO) and PG (2 cases: Stop LAPD Spying Coalition, CLEAR), with only P2P Foundation (PP) representing other types. Advocacy organizations naturally cluster in types focused on rights assertion (DS) and institutional transformation (PG).

Research & Knowledge is the third most represented sector (14%), with presence across types: ARDC, RDA, Sensorica (PP); Masakhane (DS); and collaborative presence across boundaries. This sector demonstrates how community-led initiatives engage knowledge production, often through commons approaches (PP) or culturally-grounded research (DS).

Data Sovereignty organizations concentrate in Advocacy & Rights and Indigenous Rights (8 of 12 cases). DSs' primary mode is asserting rights rather than producing goods. Only Monlam AI (Technology & Software) and Masakhane, DEF (Research & Knowledge, Digital Literacy) represent non-advocacy sectors.

Peer Production organizations distribute across Research & Knowledge, Technology & Software, and Infrastructure (9 of 12 cases). They are producers, creating research

infrastructure (ARDC, RDA), software commons (Linux Foundation), and physical infrastructure (Guifi.net). Notably, only P2P Foundation operates in Advocacy.

Digital Cooperatives concentrate in Technology & Software, Energy & Climate, and Transportation & Logistics (9 of 11 cases). Market engagement is tangible here, with cases operating in transportation (CoopCycle, The Drivers Cooperative, Namma Yatri, Les Mercedes), energy (SOLshare, Som Energia), and software (Loomio, MiData). They compete in economic sectors where cooperative alternatives can demonstrate viability.

Participatory Governance organizations distribute across sectors without strong concentration. Their defining feature is process (participatory governance) rather than sector. They bring participatory approaches to diverse domains including environmental research (CLEAR), health data (OpenSAFELY), urban development (SDI), and mobility (Open Mobility Foundation).

There are also interesting dynamics at play within the economic sectors. The Energy & Climate sector shows distinctive outcome patterns. All three cases in this sector (SOLshare, Som Energia, Solar Commons) achieve Community Value outcomes through community infrastructure and economic benefits. Two of three (SOLshare, Som Energia) achieve Impact outcomes through Climate and Ecological Transformation (IM6). The Transportation & Logistics sector focuses on worker economic outcomes. All three cases (CoopCycle, The Drivers Cooperative, Namma Yatri) achieve Worker and Member Economic Benefits (CV1). Two of three (CoopCycle, The Drivers Cooperative) achieve Policy and Regulatory Change (IM1). Finally, the Advocacy & Rights sector is skewed towards Democratic Practices and Impact outcomes, with minimal Community Value. They focus on rights assertion and policy change; their "value" is distributed (to communities whose rights are protected) rather than retained.
